orbyte.

Tomorrow’s business readiness assistant

For restaurant SMEs in Malaysia

TEAM ALLSTAR

Phan Yi Yan / Lim Jia Vei / Chin Yi Shen
Lee Wing Ho / Wong Xing You

Tomorrow’s operational blind spots

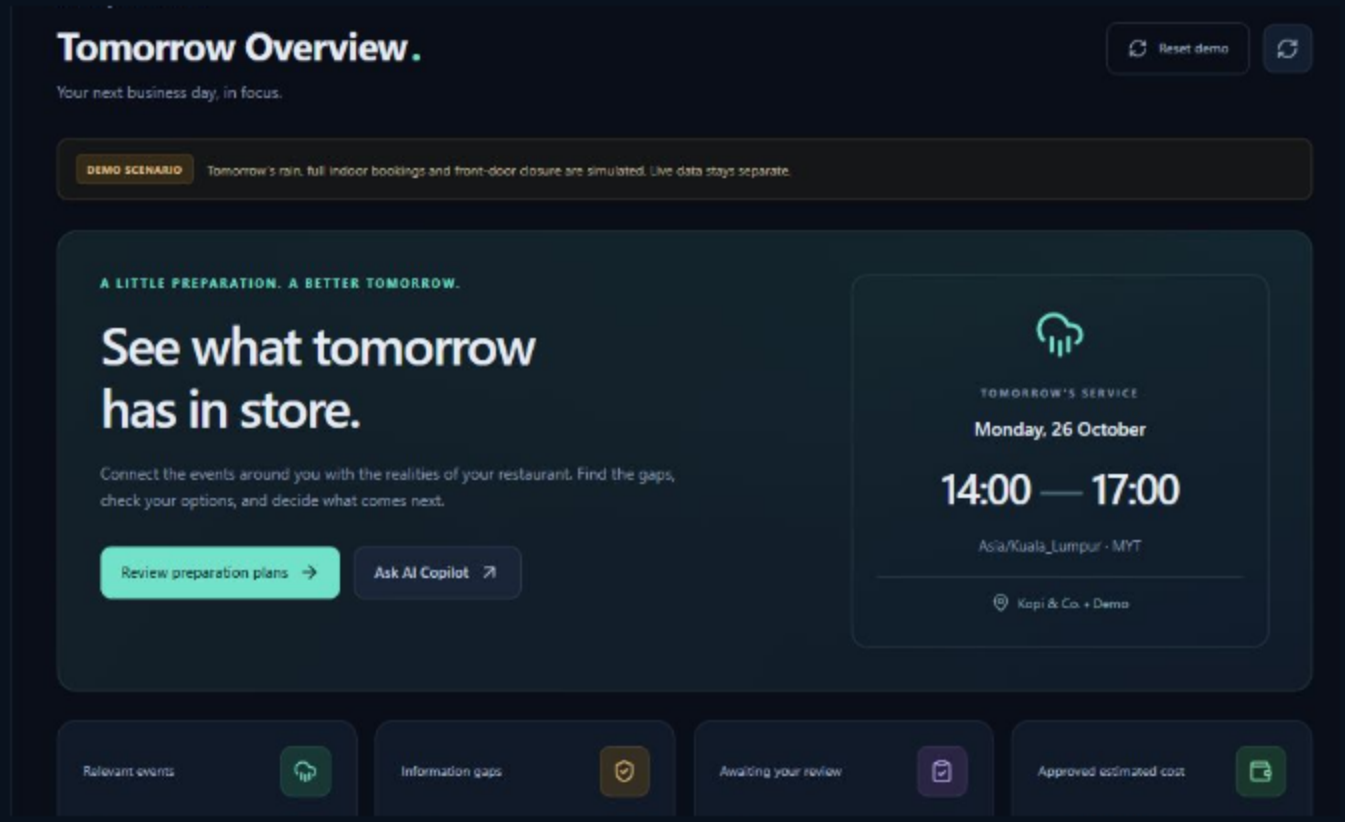

A useful alert still leaves a planning job

What affects our service window?
Which backup plan can we actually use?
What do we need to confirm?

Initial users: independent restaurants and cafés with outdoor seating or pickup operations

One readiness workflow

Discover relevant events
Check business conditions
Confirm information gaps
Approve exact actions
Track the preparation

Actual MVP interface. Rain and road closure in this scenario are simulated.

A backup plan can have its own conflict

Simulated service: tomorrow, 14:00–17:00 MYT

Candidate plan	Known condition	Rule result
Move guests indoors	40 of 40 indoor seats booked	**Conflict**
Use front pickup	Closure overlaps the service	**Conflict**
Use rear pickup	Tomorrow’s rear access unknown	**Insufficient data**

Checks cover known conditions. They cannot guarantee operational success.

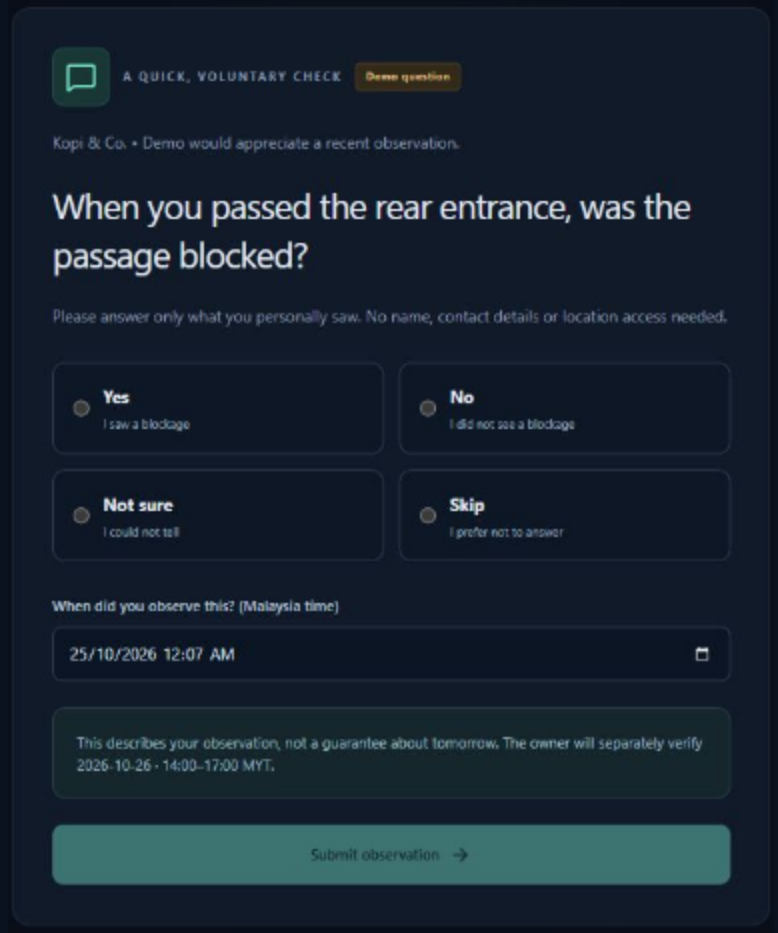

A recent observation needs a future check

Customer: “No blockage seen”

Saved as an unverified lead
Observation time stays attached

Owner verifies tomorrow’s 14:00–17:00 access

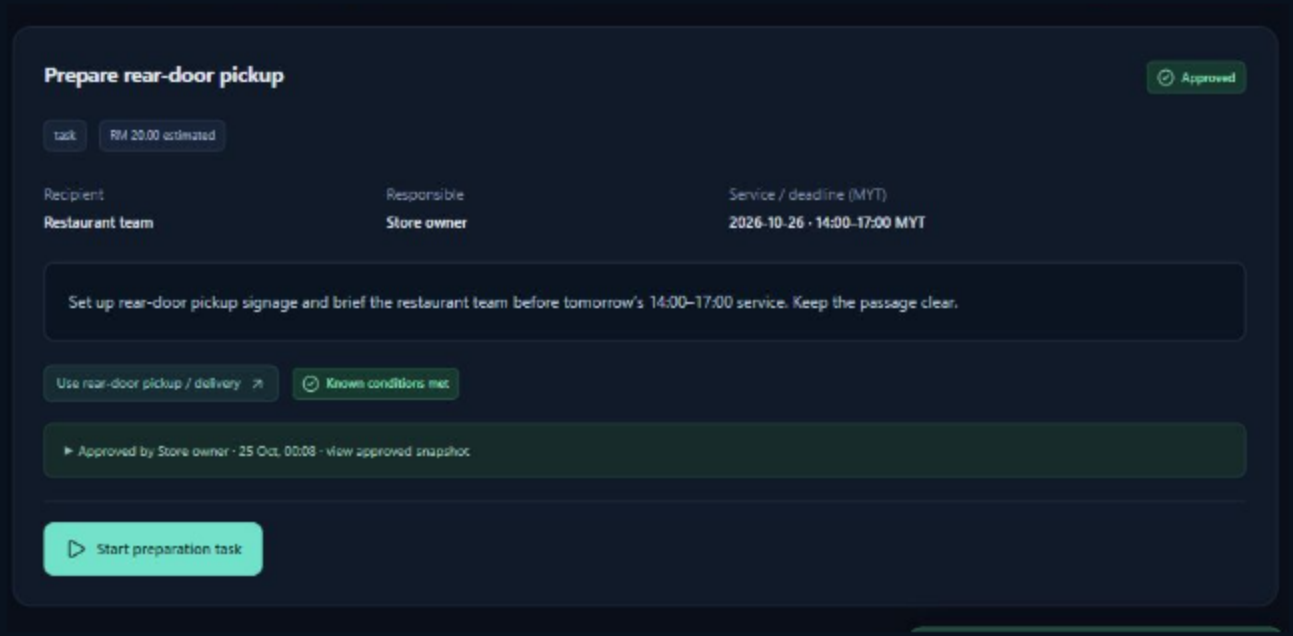

The plan updates after that check

The owner approves the exact action

Recipient and responsible person
Exact instructions and service time
Estimated cost in RM

Approval snapshot
Execution status
Completion note

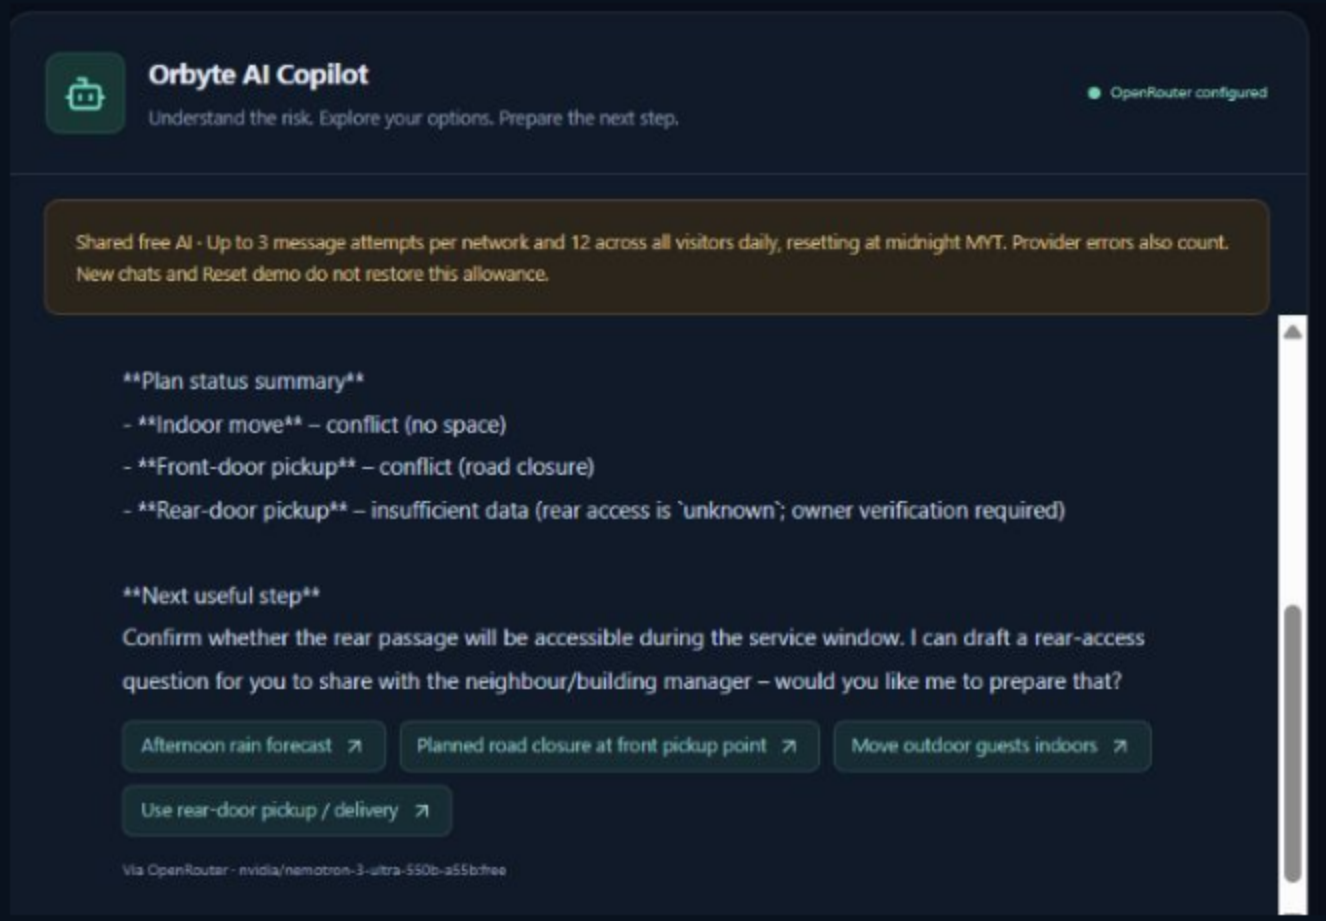

Changed conditions trigger a new review for actions that have not executed.

AI Copilot explains and prepares

“Can we switch to delivery?”

Reads the latest conditions
Explains conflicts and gaps
Creates reviewable drafts

Owner approval stays outside the model’s tools

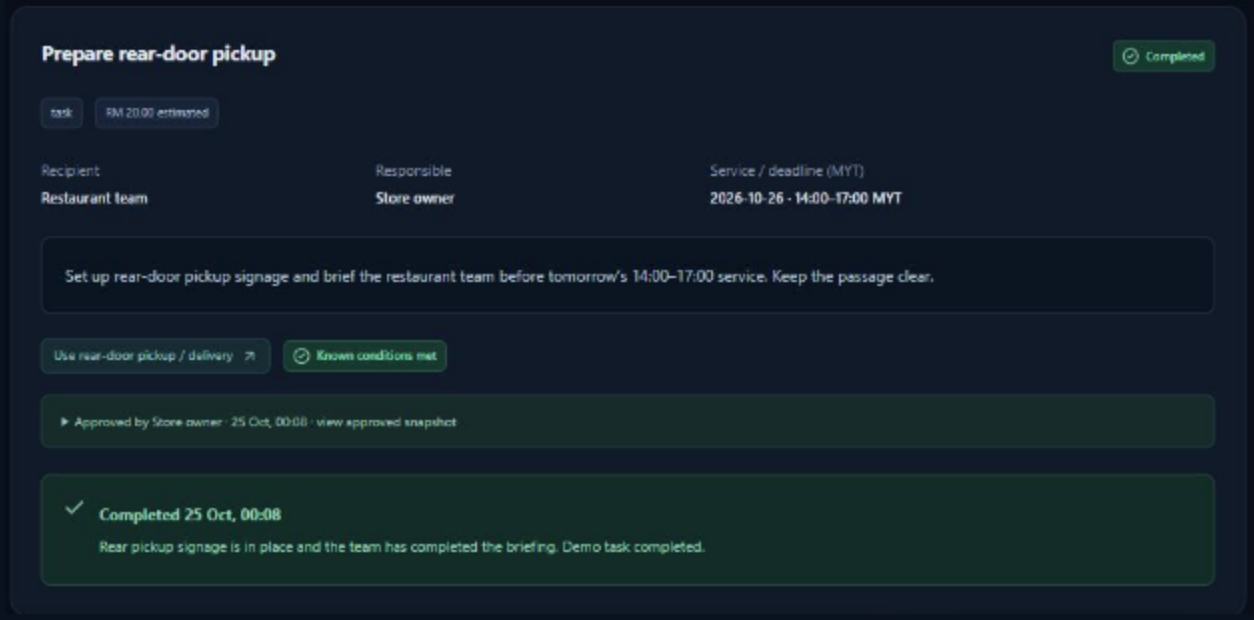

A working MVP with a tested decision flow

35

Backend rule and API tests

3

Frontend currency and time tests

Technical validation only. Merchant outcomes and willingness to pay remain untested.

A focused restaurant pilot

Proposed pilot, not launched

5 restaurants
2 weeks

Measure preparation time, unresolved conditions and tasks finished before service

Pricing hypothesis

RM 49.00

per store per month

Validate willingness to pay and the cost to serve

Architecture and responsibility

Layer	Implemented responsibility	Authority boundary
React	Profile, evidence and action views	Explicit owner operations
Flask rules	Time overlap and plan conditions	Establishes check status
OpenRouter	Explanation and draft tools	Cannot approve or execute
SQLite	Workspaces, messages and audit	Temporary on free hosting

Relevant business context goes to OpenRouter when a chat message is submitted.

MVP scope and next steps

Available now

Public simulated demo
Local Live weather and merchant notices
Rule checks and owner verification
Approval records and task tracking

Before real merchant deployment

Owner authentication
Durable records and AI limits
More official notice integrations
Real messaging and additional stores

Public demo: free hosting can sleep and reset data. External notification sends are simulated.
