The key has been saved securely. I'll restart Flask to load it and check that the app reports the Copilot as configured, without making a paid request or using the demo's AI allowance.

Tomorrow Overview
DEMO DATA
Monday, 26 October
Tomorrow Overview.
Your next business day, in focus.
Reset demo
DEMO SCENARIO
Tomorrow's rain, full indoor bookings and front-door closure are simulated. Live data stays separate.
Free online demo · Your workspace is separate for this browser. Use sample information only. Records and AI limits may reset when the service sleeps or restarts; feedback links then expire.
A LITTLE PREPARATION. A BETTER TOMORROW.
See what tomorrow has in store.
Connect the events around you with the realities of your restaurant. Find the gaps, check your options, and decide what comes next.
Review preparation plans

Started task
Set up the imported project
The user just imported this project from a GitHub repository. It could be anything — an app to run on Replit, a library, a fork to study, code to reuse — so the first thing to do is ask what they want; everything after depends on the answer.
View plan
I'll take a quick look at the README and project structure, then ask what you'd like to do with the import before making any changes.
2 actions
This is Orbyte, a restaurant-readiness app with a React frontend, Flask backend, and SQLite storage. Its AI Copilot needs an OpenRouter API key, but the rest of the app can run without it. I haven't changed anything.
What would you like to do with the imported project?
This is Orbyte, an existing React + Vite, Flask and SQLite application.
Configure this existing project to run in Replit while preserving its current design and business logic.

requested Run command on port 3000. I'll also run both test suites and check the app in preview without exposing secret values.
13 actions
Flask already serves front_end/dist, so that needs no application change. I'll add support for Replit's existing SESSION_SECRET to keep browser sessions stable across restarts, while retaining the app's current secret setting.
The OpenRouter key is not set yet. I'll finish verification first, then open a secure form for it. Without the key, the Copilot will report missing configuration as designed.
16 actions
The app is running in Replit preview with its original design. All 36 backend tests and 3 frontend tests pass, and the frontend build succeeds. Hosted-demo mode is active, with the existing limits of 3 AI attempts per network and 12 globally per Malaysia day.
The compatibility changes are limited to the Run workflow, port mapping, dependency setup, and stable session-secret support. I documented them in replit.md. Installation also flagged two existing Vite development-tool vulnerabilities; Vite is not exposed by this Flask workflow, and I haven't made a major-version upgrade.
The remaining step is adding OPENROUTER_API_KEY through the secure form.
